

PROTISTS!

- examining changes in populations and changes in species.
- Methodology:
 - make a slide - focus, find an organism - count for one minute
 - work w/ a partner - take turns, prepare new slides every time you count
 - count every protist you see at first - add 1 for each protist that swims in
 - categorize the protists by relative size - small, medium, or large

- You & your partner should each see 10 slides
- collect data for both partners - each partner should have a copy of the data.
- Once you've started counting, don't move the slide
- Use the same type of scope & same level of magnification each week
